

Comparison *HERBAGREEN®* seed quality to standard seeds

(Herbagreen seeds are seeds collected from Mr. Gorn's farm /harvest grown with Herbagreen).

- **Objective:** identify differences by using seeds that have been grown by the *HERBAGREEN®* process and compare result with market available seeds.
- **Process:** use same farming process for both types of seed.
- **Target:** identify and document difference in growth, strength, health and yield throughout whole growth cycle till harvest.
- **Location:** Lam Lukka near Bangkok, farm of Mr. Gorn and Mr. Dean, December 2010

Left side ,HG seeds,

right market available seeds

HG seeds: stronger and more branches

2nd generation *HERBAGREEN®* rice:

- better, stronger, bigger, larger, more !
- farmer counted up to 14 stems per 1 plant developed out of single seed; expect all to develop into pinnacles.
- HG seeds sprouted very strong and complete.

Farmer has never seen as many stems developed from a single seed as from his 2nd generation *HERBAGREEN®* rice..

Comparison of 38day old plants: Hg seed/standard seed

All above plants have been seed powdered and sprayed with Hg

Result after 38 days:

- Massive root development, full of fine hair roots
- Much more stems than usual / expect to generate more pinnacles and more yield
