

1. HERBAGREEN® can be used with any commercially available pump/ air-pressure spray system or common agricultural spray system.
2. Mix the corresponding dose of HERBAGREEN® with water (according to the specifications of the individual plant types) and afterwards shake or stir it vigorously. Pump/airpressure spray systems for agricultural use are usually equipped with an integrated swirl mechanism.
3. HERBAGREEN® can also be applied onto the plants in greenhouses via spraying systems. In the case of a daily application the concentration of suspension is reduced to a 0.1% solution.
4. HERBAGREEN® should be preferably applied in the morning or evening, in order to benefit from the high air humidity and dew formation during the night, resulting in a better absorption.
5. HERBAGREEN® is a leaf manure and can already be applied as such from the second - third foliation.
6. Do not mix HERBAGREEN® with plant protection products such as pesticides and herbicides!
7. In open land HERBAGREEN® should not be applied during rain weather.
8. HERBAGREEN® is appropriate for all types of plants.
9. When mixing HERBAGREEN® leaf manure with splash water, the formation of dust should preferably be avoided, and if necessary, a respirator mask should be worn.

It is important to spray HERBAGREEN® in the form of a fine fog, so that it can easily penetrate the leaf. The best time for spraying is morning or evening at humidity > 60%. Number of treatments/applications depends on environment and actual situation, recommended dosage of 3 to 5 times could be increased up to 8 times if actual conditions so require.
