

This cycle starts with every application of HERBAGREEN®. The more applications, the better for the Tree or Plant.

1. HERBAGREEN® is sprayed on to the leaves of a plant in the morning or in the evening.
2. Within short time, the Photosynthesis of the leaves by using sunlight increases significantly by HERBAGREEN®. The leaves produce more Glucose and Starch.
3. Due to the increased production of sugar in the leaves, the plant or tree stimulates its water- and nutrient supply out of the soil in order to use and transform the additional sugars.
4. The Tree (or the plant) uses more water than the roots can now provide. So it puts down more roots. More roots can now transport more water and can provide more nutrients (N, P, K).

5. The additional roots are now transporting more nutrients. This benefits
- the blossoms as well as
 - the fruits.

The tree must neither throw off blossoms nor fruit sets. The result: more harvest, increasing fruit quality (higher BRIX) and a healthy tree. The plants stay healthier and stronger.

6. Any additional Cycle of applying HERBAGREEN® increases the positive effects of the described cycle. ® increases the positive effects of the described cycle.
